

Atkan Ismail Öztunç

Software Engineer | AI & Automation | Product Engineering
Remote | Open to International Opportunities

Email: atakanfisc@gmail.com | GitHub: <https://github.com/Atakan-24> | Portfolio: <https://atakan-24.github.io/>

Profile

Self-taught software engineer with approximately 3 years of hands-on development. Builds AI/LLM applications, automation, backend systems and full-stack products end to end, with a strong emphasis on testing, failure handling, security and data correctness. Public work includes 25+ systems/projects, including developer tools and production-oriented business software. Brings an additional commercial perspective from ongoing affiliate/e-commerce work, sales, content and customer acquisition.

Core Technical Skills

- Languages: Python, TypeScript, JavaScript / Node.js
- AI & Automation: LLM applications, AI agents, workflow automation, API integrations, AI-assisted development
- Backend & Data: REST APIs, PostgreSQL, Supabase, data processing, pagination, correctness
- Web & Product: Next.js, full-stack web applications, product prototyping, developer tooling
- Quality: automated testing, regression testing, property-based testing, CI/CD, debugging, maintainability
- Security: credential scanning, secret masking, read-only boundaries, fail-closed design

Engineering Experience

Independent Software Engineer / Builder | Self-directed | 2023 - Present

- Build end-to-end software through self-directed learning, iterative development and real-world problem solving.
- Work across AI/LLM applications, automation, backend services, full-stack products, security utilities, developer tooling and infrastructure-oriented systems.
- Design for failure modes as well as happy paths: validation, regression tests, data integrity, explicit error states and safe failure behavior.
- Maintain public repositories with documentation, tests, CI workflows, architecture decisions, trade-offs and known limitations.
- Current objective: turn this engineering foundation into client and contract work for B2B software, AI systems and automation.

Independent Affiliate & E-commerce Business | Digital business | Ongoing

- Current primary income stability while the software engineering track is being built.
- Earlier and ongoing experience across e-commerce, affiliate marketing, YouTube/content, sales, outreach and online customer acquisition.
- Developed practical skills in offers, customer behavior, acquisition channels, experimentation and commercial execution.

Selected Engineering Work

git-secret-scan | Python / Security

Pre-commit hook + GitHub Action that prevents API keys and tokens from reaching commits.

Evidence: 98 tests, 98% coverage, labelled benchmark at 100% precision / 100% recall, masking and fail-closed environment handling.

postgres-keyset-page | Node.js / Backend

Dependency-free keyset pagination for PostgREST-style REST APIs, designed to prevent silent row loss or duplication when datasets change during pagination.

Evidence: regression test reproducing the failure mode, 9 tests, CI on Linux/macOS/Windows, Node 18 and 22.

gh-radar | Python / GitHub API

Read-only GitHub assistant that watches personal repositories, filters noisy contribution opportunities, scores issues and explains why a suggestion is worth attention.

Evidence: read-only HTTP boundary is enforced and tested.

Additional Public Projects

- **yt-transcript** - Python/data/automation tooling for processing YouTube transcripts and external data through fallback-oriented workflows.
- **gitingest** - developer tooling for structured repository-content ingestion.
- **faharr** - arabic spaced-repetition product exploring practical software, offline-first behavior and IA/product workflows.

Engineering Approach

I prefer explicit, understandable systems over unnecessary complexity. I treat "it works" as a hypothesis until tests, failure handling and reproducible evidence support it. I use AI coding agents deliberately with clear specifications, guardrails and verification, and document architecture decisions, trade-offs, failures and known limitations.

Education & Learning

Fachabitur - Metalltechnik | Completed

Software Engineering / AI / Automation | Self-directed learning | 2023 - Present

Technical ability is demonstrated through public code, projects, tests and documented engineering decisions.

Target Roles

AI Engineer | AI Automation Engineer | Product Engineer | Full-Stack Engineer | Backend Engineer | Contract Software Engineer | Founding Engineer | Technical Consultant
