

Atakan Ismail Öztunç

Software Engineer | AI & Automation | Product Engineering

Remote | Open to International Opportunities | atakanfisc@gmail.com | github.com/Atakan-24 | atakan-24.github.io

PROFILE

Self-taught software engineer with approximately 3 years of hands-on development, focused on AI, automation, backend systems, full-stack product engineering, and reliability. I build from problem definition through implementation, testing, documentation, and delivery. My public GitHub work shows practical engineering depth across security tooling, data correctness, GitHub integrations, developer tools, and AI-oriented products. Before software, I built experience in e-commerce, affiliate marketing, content, sales, and online customer acquisition - giving me a commercial and product-oriented perspective alongside engineering.

CORE TECHNICAL SKILLS

Languages & Runtime: Python, TypeScript, JavaScript / Node.js

AI & Automation: LLM applications, AI agents, workflow automation, API integrations, AI-assisted development

Backend & Data: REST APIs, PostgreSQL, Supabase, data processing, pagination and correctness

Web & Product: Next.js, full-stack web applications, product prototyping, developer tooling

Quality & Reliability: Testing, regression prevention, property-based testing, CI/CD, failure handling, maintainability

Security: Credential scanning, secret masking, read-only API boundaries, fail-closed design

ENGINEERING EXPERIENCE

Independent Software Engineer / Builder | Self-directed | 2023 - Present

- Built software systems end-to-end through self-directed learning, practical experimentation, and iterative project work.
- Worked across AI/LLM applications, automation, backend services, full-stack products, security utilities, developer tooling, and infrastructure-oriented concerns.
- Design around real failure modes rather than only happy paths: validation, regression tests, data integrity, explicit error states, and fail-closed behavior.
- Maintain public GitHub repositories with documentation, tests, CI workflows, architectural decisions, trade-offs, and limitations.
- Currently focused on turning this engineering foundation into client and contract work for B2B software, AI systems, and automation.

Affiliate / E-commerce & Online Business | Independent digital business | Ongoing

- Current primary income stream, providing financial stability while building a second professional track in software engineering.
- Earlier work across e-commerce, affiliate marketing, YouTube/content, sales, outreach, and online customer acquisition.
- Developed practical experience with offers, customer behavior, acquisition channels, experimentation, and commercial execution.

SELECTED ENGINEERING WORK

git-secret-scan | Python / Security

Pre-commit hook and GitHub Action that prevents API keys and tokens from reaching commits. Includes masking, multiple credential patterns, local and CI scanning, and explicit handling of environment failures. **98 tests** | **98% coverage** | **measured benchmark: 100% precision / 100% recall on the labelled corpus**

postgrest-keyset-page | Node.js / Backend

Dependency-free keyset pagination for PostgREST-style REST APIs, designed to prevent silent row loss or duplication when datasets change during pagination. Includes a test that reproduces the failure mode. [9 tests](#) | [CI on Linux, macOS, Windows](#) | [Node 18 and 22](#)

gh-radar | Python / GitHub API

Read-only GitHub assistant that watches personal repositories, filters noisy contribution opportunities, scores issues, and explains why a suggestion is worth attention. [58 tests](#) | [read-only HTTP boundary enforced and tested](#)

ADDITIONAL PUBLIC PROJECTS

yt-transcript | Python / Data / Automation

Tooling for processing YouTube transcripts and integrating external data sources through a fallback-oriented workflow. [40 tests documented in the public profile README](#)

gitingest | Developer Tooling

Repository-content ingestion designed to produce a structured, searchable representation for developer workflows. [Public work sample](#)

fahm | Software / AI / Learning

Arabic spaced-repetition product exploring practical software, offline-first behavior, and AI/product workflows. [Public product-oriented work sample](#)

HOW I ENGINEER

- I prefer small, explicit systems that are easy to reason about and verify rather than unnecessary complexity.
- I treat “it works” as a hypothesis until tests, failure handling, and reproducible evidence support it.
- I use AI coding agents deliberately, with clear specifications, guardrails, and verification rather than accepting generated output blindly.
- I document why a design exists, what trade-offs were made, what broke, and what the system deliberately does not do.

EDUCATION & LEARNING

Technical College Entrance Qualification (Fachabitur) | Metalltechnik | Completed

Software Engineering / AI / Automation | Self-directed engineering | 2023 - Present

- Approximately three years of intensive practical learning through building, debugging, testing, documentation, and production-oriented experimentation.
- Non-traditional path: no university degree; engineering ability demonstrated through public work samples, code, and documented technical decisions.

ROLE FIT

- AI Engineer | AI Automation Engineer | Product Engineer | Full-Stack Engineer
- Backend Engineer | Contract Software Engineer | Founding Engineer | Technical Consultant
